

Generative Adversarial Networks (GANs)

Generative Adversarial Networks

Introduction

- Type of deep learning network
- Two neural networks
 - Generator
 - Discriminator
- Discriminator tries to classify real from fake-images
- Generator tries to create (fake) images that are classified as real images
- Both networks contest each other in a zero-sum game
- Both trained simultaneously

Generative Adversarial Networks

Architecture

Generative Adversarial Networks

Applications

- Face Generation ([Link](#))

Generative Adversarial Networks

Applications

- Medicine
 - Produce data for rare diseases
- Video
 - Deep fake
 - Increase frame rate of videos (Dual Video Discriminator GAN)
- Music
- Artwork
 - Produce new artwork (SkeGAN, [GANpaint](#))
- Speech
 - GAN based text-to-speech ([GAN-TTS](#))
- Robotics

Generative Adversarial Networks

Advantages / Disadvantages

- Interesting concept
- Image upsampling (higher resolution of actual images)
- Generate music, videos

- Simultaneous training hard
- Very computationally expensive
- Deepfakes
